Performance Audit & Fixes

Bottlenecks Found

#	Issue	Impact	Fix
1	**Material Icons font loaded but never used** — `index.html` loads `googleapis.com/icon?family=Material+Icons` (~250KB) but MUI uses SVG icons via `@mui/icons-material`	🔴 ~250KB wasted download, render-blocking	Remove the `<link>`
2	**Google Fonts loaded TWICE** — `index.html` loads Poppins, and `index.css` imports Poppins + Space Grotesk via `@import url(...)` (render-blocking CSS `@import`)	🔴 Duplicate 200KB+ download, double render-block	Remove `index.html` link, convert CSS `@import` to `<link rel="preload">` with `display=swap`
3	**Two Unsplash images fetched from CDN** — Hero bg (photo-1555396273, ~500KB) and About section (photo-1577219491, ~400KB) loaded from unsplash at full resolution `q=85`	🔴 ~900KB external fetch, TTFB dependent on Unsplash CDN	Reduce to `w=1200&q=60` for hero, `w=800&q=60` for about. Add `loading="lazy"` to about image
4	**No code splitting** — entire app in one 603KB JS bundle	🟡 Everything parsed before first paint	Split below-fold sections into lazy-loaded chunks via `React.lazy()`
5	**Unused assets in repo** — `Gemini_Generated_Image.png` (636KB), `logo.png` (321KB), `file.svg` (265KB), `darkThemeLogo*.png` (365KB) not imported anywhere	🟡 Bloats git clone / CI build	Delete unused files
6	**Global `transition` on `*` selector** — every element transitions `background-color`, `color`, `border-color`, `box-shadow` constantly	🟡 GPU thrash, janky scroll/animations	Scope to theme-switch only
7	**No Vite compression** — dist serves uncompressed assets, no gzip/brotli pre-compression	🟡 ~40% larger transfer size than necessary	Add `vite-plugin-compression` for gzip + brotli

Estimated Savings

Metric	Before	After (est.)
Total assets downloaded	~2.5 MB	~800 KB
Render-blocking resources	3 (fonts + icon CSS)	0
JS chunks	1 (603KB)	3-4 (~250KB initial + lazy)
External image payload	~900KB	~350KB
